

Fish Migration?

Worldfishmigrationday.com | @fishmigration

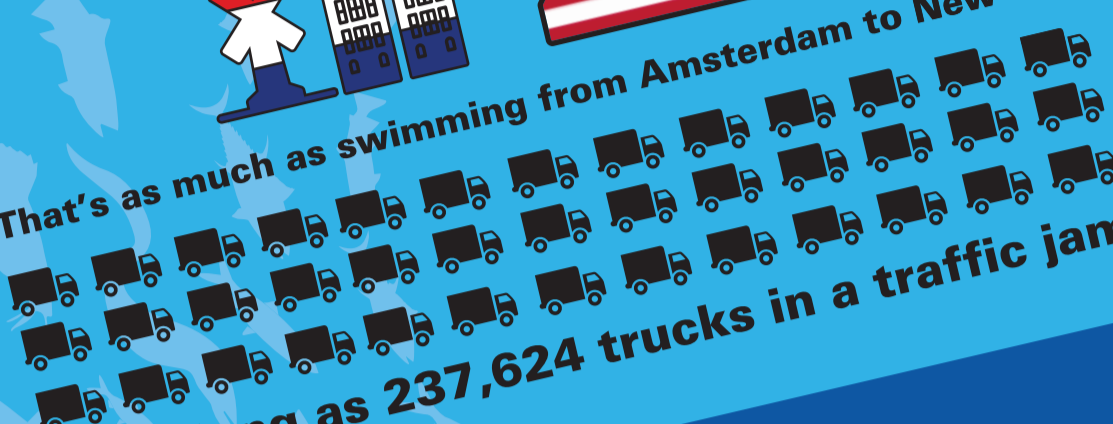

Fish migration is the journey that fish make to reproduce or feed

Some fish swim over 6000km

That's as much as swimming from Amsterdam to New York

Or as long as 237,624 trucks in a traffic jam

Fish migration contributes to many things

Food

Sport

Nature

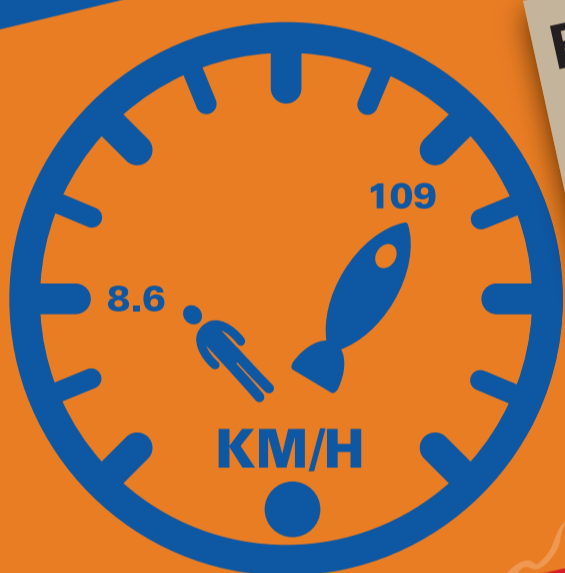

Fastest swimming speed

109 km/h

8.6 km/h

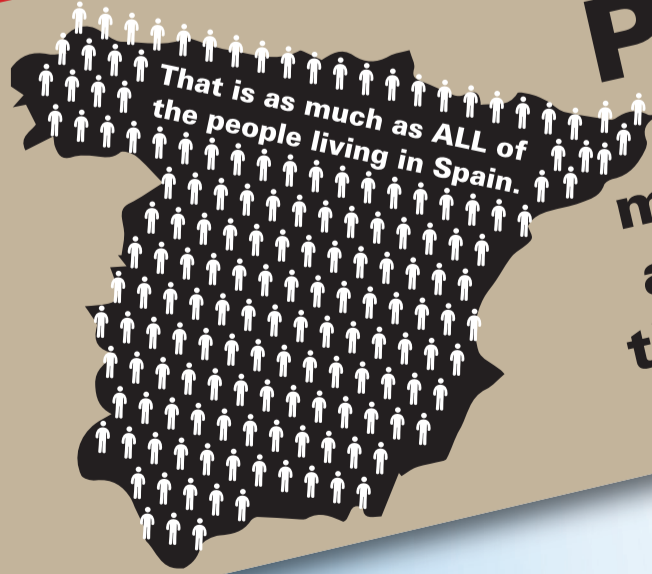

Unfortunately, fish can't travel like we can. They encounter barriers such as dams.

Fishery losses in the Columbia Basin were estimated at \$6.5 billion between 1960 and 1980. But with much help over 1 million salmon returned in 2015.

48 MILLION PEOPLE

depend on migrating fish as a food source in the lower Mekong river.

That is as much as ALL of the people living in Spain.
